

# Instructions for installation of custom skin...

1. Mixing and matching the modules, choose your preferred layout.  
If you prefer your base to have a straight edge, then choose from folder 1. If you prefer the tabbed look, choose from the images in folder 2. (It won't look right if you mix the images between folders...) You will need one image module from each column.
2. Locate the .tga file that matches each module, (using this sheet as a reference) and copy them to your desktop, (or preferred location). You should have 4 .tga files... (one from each column.)
3. Choose a name that appeals to you... (I'll use "tigger" as an example... but you can use any name...) and re-name those newly copied .tga files using this format:

The module that came from column 1 must end with -1.tga

The module that came from column 2 must end with -2.tga

The module that came from column 3 must end with -3.tga

The module that came from column 4 must end with -4.tga

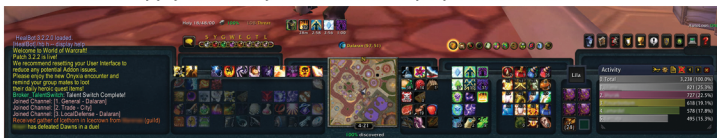

example: I choose a tabbed composition with the following modules...

so I would rename:

column_1_tab_v1.tga	...TO...	tigger-1.tga
column_2_tab_v1.tga	...TO...	tigger-2.tga
column_3_tab_v1.tga	...TO...	tigger-3.tga
column_4_tab_v1.tga	...TO...	tigger-4.tga

**NOTE: you MUST rename files for these skins to work--they will not work if their file names do not match...**

4. Log out of WoW
5. Place the four renamed files into the BTex Skins Folder:  
Here's the path on my computer...  
My Computer/C:/Program Files/World of Warcraft/Interface/AddOns/Btex/Skins
6. Log into WoW
7. type /btx menu
8. Choose "<CUSTOM SKIN>..."
9. Type "tigger" in the "set name" box ...  
click apply skin and you will see the opaque unsized skin...

10. Select your settings for color/size/transparency and click: apply skin.  
You can see how the skin looks by applying different settings before you exit...
